ABSTRACT

In this study, we used the Path integral method to obtain the bound state solutions of the Hellmann potential. Firstly we analytically derived the radial kernel expression of the Hellmann potential using the approximation of the centrifugal term and space-time transformations. Then we calculated the exact energy spectrum and the normalized eigenfunction from the poles of the Green function and their residues. We expressed normalized wave functions in terms of Jacobi polynomials and Hypergeometric functions.

Keywords: Path integral; Hellmann potential; Green’s function; space-time transformation; centrifugal term.

1. INTRODUCTION

In recent years, numerous studies have been carried out to obtain the analytical full solutions of the wave equations of various potentials in relativistic and non-relativistic quantum mechanics. Many methods are used for this purpose: SUSYQM formalism the Nikiforov-Uvarov approach, Functional analysis approach, Factorization method, Path Integral, the power series expansion, the asymptotic iteration method [1–10].

The Hellmann potential expressed as the sum of Yukawa and Coulomb potentials is:

\[ V(r) = -\frac{A}{r} + B e^{-ar} . \]  

(1)

Here \( A \) and \( B \) are the strengths of potentials and \( a \) is the screening parameter. \( A \) and \( B \) may also be positive and negative, assuming positive parameters \( a \). The Hellmann potential, which has many applications in atomic physics and condensed physics, is used to represent electron-nuclei and electron-ion interactions [11-17]. It has been used as a model for potential alkaline hydride molecules and has been found to be an appropriate potential for studying inner shell ionization problems [18,19,20].

Feynman path integral is one of the methods of obtaining analytical solution used to describe the energy spectrum and wave functions of systems. This method is in complete agreement with the general formalism of quantum mechanics suggested by Schrödinger, Heisenberg and Dirac. It is based on the propagator containing quantum mechanical amplitude for a point particle at a position \( x_a \) at time \( t_a \) to reach a position \( x_b \) at timer \( t_b \) integrate over all possible paths connecting by the classical action. Using path integral method, the kernel of the system and the Green function are obtained so that they can be derived with the help of the energy spectrum and the corresponding wave functions [21]. Although the path integral method is a powerful method, it is difficult to calculate the path integral for a number of quantum mechanical systems. Duru and Kleinert developed a method called Kustaanheimo-Stiefel (KS) transformation in order to apply this method to the H-atom problem in 1979 [5]. Then, relativistic and non-relativistic wave equations of various potentials were studied: the Morse oscillator, the Woods-Saxon potential, the Hulthen potential [6-10]. In spherical symmetric systems, the centrifugal barrier term appears, which plays an important role in the scattering problems of the physics. The Schrödinger equation with some exponential type potentials does not have analytical l-wave solutions. For such potentials, they must use approximation schemes because of the term centrifugal barrier. Several methods have been used to obtain exact or approximate solutions of the Schrödinger equation for exponential type potentials [12-17].

The object of this study is to evaluate energy spectrum and wave functions of the Hellmann potential via path integral method. The organization of this paper is as follows. In section 2.1 Kernel and energy dependent Green’s function of Hellmann potential are derived using space-time transformation. In section 2.2 energy eigenvalues and the corresponding wave functions are obtained using Green’s function.

2. MATERIALS AND METHODS

2.1 The Kernel of the Hellmann Potential

The kernel of spherical symmetric potential between the initial position \( r' \) at time \( t' = 0 \) and final position \( r'' \) at time \( t'' \) has the following form [22]:

\[ K(r'', t''; r', t') = \frac{1}{(3\pi m)^{3/2}} \sum_{l=0}^{\infty} \frac{(2l+1)}{4\pi} K_l(r'', t''; r', t') P_l(\cos \theta) \]  

(2)

where \( P_l(\cos \theta) \) is the Legendre Polynomial with the \( \theta \equiv (r^-, r') \) and \( K_l(r^-, t; r', t') \) is the radial Kernel in the time interval \( \Delta t_j \). Path integral express in terms of an integral over all paths in configuration space. Radial kernel is described as

\[ K_l(r'', t''; r', t') = \lim_{n\to\infty} \int \sum_{j=1}^{N} \exp \left[ \frac{i}{\hbar} S_j \right] \prod_{j=1}^{N} \left( \frac{m}{2\pi\hbar^2} \right)^{1/2} \prod_{j=1}^{N-1} dr_j \]  

(3)

Here \( S_j \) is partial action and \( \Delta t_j = r_j - r_{j-1}, \epsilon = t_j - t_{j-1}, t^- = t_b = t_a, t^+ = t_a = t_b \). Partial action is

\[ S_j = p_j (r_j - r_{j-1}) - \frac{p_j^2}{2m} + \frac{h^2 l(l+1)}{2\mu r^2} + V(r_j) \]  

(4)

Using the term of the following approximation instead of the centrifugl term

\[ \frac{1}{r^2} = \frac{a^2}{(1-e^{-ar})^2} \]  

(5)
inserting the radial kernel Eq. (3) becomes

\[ K_r(r', \theta'; \alpha, \mu) = \lim_{n \to \infty} \sum_{j=1}^{n} \frac{d p_j}{2 \pi} \exp \left( \frac{\mu}{\hbar} \sum_{j=1}^{n+1} (p_j - r_{j+1}) \right) \]

\[ \frac{p_j^2}{2 \mu} - \frac{\hbar^2}{2 \mu} \left( \frac{\alpha^2}{(1 - e^{-\alpha r})^2} \right) \times V(r_j). \]  

(6)

Defining the new angular variable \( \theta \in (0, \pi) \) to transform the radial variable \( r \in (0, \infty) \)

\[ r = -\frac{1}{\alpha} \ln(-\cot^2 \theta) \quad \text{and} \quad p_r = \frac{\alpha}{2} \sin \theta \cos \theta p_\theta \]  

(7)

the kernel in Eq. (6) can be written as

\[ K_r(\theta^*, \theta; \alpha, \mu) = \frac{\alpha}{2} \sin \theta \cos \theta \int D\theta Dp_\theta \exp \left[ i \int_0^{T(0)} dt \left[ p_\theta \dot{\theta} \right. \right. \]

\[ \left. - \frac{\alpha^2}{4} \frac{\hbar^2}{\alpha^2} \sin^2 \theta \cos^2 \theta p_\theta^2 \right. \]

\[ \left. - \frac{\hbar^2}{2 \mu} \left( \frac{\alpha^2}{(1 - e^{-\alpha r})^2} \right) \times V(r_j) \right] \]  

(8)

where \( \sin \theta \cos \theta \) is the contribution to Jacobien because of the coordinate transformation in Eq. (7). When the factor \( \alpha^2 \sin^4 \theta \cos^2 \theta \) in front of kinetic energy term is the eliminated by the time transformation [6-9]

\[ \frac{dt}{ds} = \frac{4}{\alpha^2 \sin^2 \theta \cos^2 \theta} \]  

(9)

the Fourier transform of the \( \delta \) function is added to the kernel as follows

\[ 1 = \int dS \left[ \frac{4}{\alpha^2 \sin^2 \theta_b \cos^2 \theta_b} \right] \delta(T - \int ds \left[ \frac{1}{\alpha^2 \sin^2 \theta \cos^2 \theta} \right]) \]  

(10)

Then radial kernel becomes

\[ K_r(\theta^*, \theta; \alpha, \mu) = \frac{1}{\alpha \sin \theta_b \cos \theta_b} \int_{-\infty}^{\infty} \frac{dE}{2\pi} e^{iEt} \int_0^{\infty} dS \int D\theta Dp_\theta e^{i\frac{\hbar^2}{2}(l + 1)S} \]

\[ \times \exp\left( i \int_0^S \left[ p_\theta \dot{\theta} - \frac{p_\theta^2}{2\mu} - \frac{8\mu B}{\alpha} + \frac{8\mu E}{\alpha^2} \right] \right) \cos^2 \theta + \frac{4\hbar^2}{\alpha^2} \left( \frac{\alpha^2}{(1 - e^{-\alpha r})^2} \right) \]  

(11)

We can symmetrize the contribution from Jacobien to coordinate transformation as follows

\[ \frac{1}{\sin \theta_b \cos \theta_b} = \frac{2}{\alpha \sqrt{2 \theta_a \sin 2 \theta_b}} \exp \left( i \int_0^S ds (-i) \frac{\cos 2 \theta}{\sin 2 \theta} \right) \]  

(12)

Thus Eq. (11) takes

\[ K_r(r'', r'; \alpha, \mu) = \int_0^\infty dS e^{i\frac{2\hbar^2(l + 1)S}{\mu}} \int_{-\infty}^{\infty} \frac{dE}{2\pi} e^{iEt} \frac{1}{\alpha \sqrt{2 \theta_a \sin 2 \theta_b}} K(\theta_b, \theta_a; S) \]  

(13)
The path integral solutions of the Trigonometric Pöschl-Teller potential are well known that the kernel in Eq. (14) can be reduced to the potential of this potential

\[
K(\theta_a, \theta_b; S) = \int D\theta Dp \exp\left(i \int_0^S ds [p_\theta \dot{\theta} - \frac{p_\theta^2}{2\mu} - \frac{1}{2\mu} \left(\kappa(\kappa - 1) + \lambda(\lambda - 1)\right) \frac{\sin^2 \theta}{\cos^2 \theta}]ight)
\]

and \(\kappa\) and \(\lambda\) are

\[
\kappa = \frac{1}{2} \left[1 \pm \sqrt{1 + \frac{32}{\alpha} \left(\frac{\mu E}{\alpha} + \mu B\right)}\right]
\]

\[
\lambda = \frac{1}{2} \left[1 \pm \sqrt{1 + \frac{32}{\alpha} \left(-\mu A + \frac{\hbar^2}{2}(l + 1) + \frac{\mu E}{\alpha}\right)}\right]
\]

The expression of the kernel in Eq. (16) in relation to the wave functions is as follows

\[
K(\theta_a, \theta_b; S) = \sum_{n=0}^{\infty} \exp\left[-i(S/2)(\kappa + \lambda + 2n)^2\right] \psi_n(\theta_a)\psi^*_n(\theta_b)
\]

Where

\[
\psi_n(\theta) = \sqrt{2(\kappa + \lambda + 2n)} \frac{\Gamma(n + 1)\Gamma(\kappa + \lambda + n)}{\Gamma(\lambda + n + 1/2)\Gamma(\kappa + n + 1/2)} \times (\cos \theta)^{\lambda/2}(\sin \theta)^{\kappa/2} p_n^{(\kappa - 1/2, \lambda - 1/2)}(1 - 2 \sin^2 \theta)
\]

and energy spectrum is \(e_n = \frac{1}{2} (\kappa + \lambda + 2n)^2\).

Using the kernel, we can obtain the Green’s function. The Green’s function for Hellmann potential is written as

\[
G(x_b, x_a; E) = \frac{-4i}{\alpha \sin 2\theta_a \cos 2\theta_b} \times \sum_{n=0}^{\infty} \int_{2\pi}^{2\pi} dE \frac{e^{iET}}{(\kappa + \lambda + 2n)^2 - 4 \frac{\hbar^2}{\mu} (l + 1)} \psi_n(\theta_a)\psi^*_n(\theta_b)
\]

\[
E_n = -\frac{\alpha}{32\mu} - \alpha A + \frac{\hbar^2 a^2 l(l + 1)}{2\mu}
\]

### 2.2 Energy Eigenvalues and Wave Functions

Green’s function and Kernel for the Hellmann potential was calculated in section (2.1) using Feynman Path integral method. Integrating over dE, the energy eigenvalues can be derived from the poles of the Green function as
We can write the wave function in Eq. (13) with the terms of the hypergeometric functions as

$$\phi(x) = \sqrt{(\kappa_n + \lambda_n + 2n)} \left[ \frac{\Gamma(n + 1)\Gamma(\kappa_n + \lambda_n + n)}{\Gamma(n + \kappa_n + 1/2)} \frac{\Gamma(n + 1/2)}{\Gamma(n + 1)} \right]^{1/2} \times \frac{(-ie^{-ar})^{1/2}}{a(1 - e^{-ar})^{\kappa_n + \lambda_n - 2}(1 - e^{-ar})^{1/2}} \times F\left(-n, \kappa_n + \lambda_n + n, \lambda_n + 1/2, -e^{-ar}\right).$$

Therefore we evaluated energy spectrum and wave functions for the Hellmann potential.
3. CONCLUSIONS

In this work, we have investigated the Schrödinger Equation with the Hellmann potential for \( n, l \) quantum states. We used space-time transformation to obtain energy eigenvalues and corresponding wave functions. We expressed normalized wave functions in terms of Jacobi polynomials and Hypergeometric functions.
